VARIETY: GILA

EXHIBIT A

Origin and Breeding History of the Variety

1. Gila originated from a hand pollinated cross between Climax and Calmar. The cross was made in the Salinas Valley of California in 1975. <sup>69</sup> 7/8 5/9/78
2. Initial trial plantings were conducted in 1971 to allow for individual plant selection work. Follow up plantings were conducted to allow for segregation and further selection work. Selections were made on the basis of texture, size and heading tendencies.
3. The procedures involving trial plantings, evaluations and plant selections were repeated numerous times before attaining the desirable type. These plantings were conducted in Arizona and California with the final selection process taking place in the Salinas Valley of California.
4. Gila is genetically uniform and free of any distinct variation.

VARIETY: GILA

EXHIBIT B

Botanical Discription of The Variety

Annual, a crisphead variety with medium sized frame. Wrapper leaves provide similar head protection as is seen in the variety Calmar. Wrapper leaf is similar to Calmar in size and smoothness.

Head is spherical. Butt of plant is medium smooth (similar to Calmar). Adapted for April harvest in the Salinas Valley of California. Will produce a <sup>1 1/2</sup> 5 1/2" to <sup>1 1/2</sup> 6" diameter sized head under normal weather conditions.

Seedstalk of medium height, very uniform. Produces a medium sized panicle and is an average seed yielder. Seed color is white.

VARIETY: Gila

EXHIBIT D: Data Indicative of Novelty

GILA most closely resembles the variety Calmar. Its distinguishing features when compared to Calmar include:

1. It is from 3 to 5 days earlier in reaching market maturity.
2. Its greatest advantage is that it will produce a larger head size than Calmar when planted in season (winter).
3. Its leaf surface is more blistered than Calmar.
4. Its range of adaptability is more restrictive than Calmar.
